

Murata™ Step Block Installation

Murata™ Step blocks are a great way to quickly and efficiently build a durable stairway. There are a couple of things to keep in mind when building steps to ensure that the end users are happy with the end result.

Most people find stairs with a rise and run that equals 18" the most walkable. With Murata™ Step blocks, this equates to a 6.875" rise with an 11" run. While you could make the stairs steeper if your site dictates, this layout will result in a stairway that is easy for most people to ascend.

The maximum recommended run for Murata™ Step blocks is 14". This will result in a rise/run sum of 20.875", which most people will still find walkable.

There is no structural problem with installing Murata™ Step blocks behind each other. However, it will result in a rise/run sum that is outside of what is considered easily walkable.
